

02. Ayurvedic Formulations and Medicinal Plants

IP-SAKTI Sahayak — RAG Knowledge Base

Purpose

Reference for retrieving general information about Ayurvedic formulations and medicinal plants without presenting the system as a substitute for professional medical advice.

Formulations

Ayurvedic medicines can be prepared according to authoritative Ayurvedic texts or as patent/proprietary medicines subject to applicable Indian requirements. A formulation should be identified by its name, ingredients, dosage form and relevant source where available.

Medicinal plants

Plant-based materials used in Ayurveda should be distinguished from a legally approved finished medicine. Botanical identity, quality, contamination, processing and manufacturing controls can matter for product quality.

Quality and manufacturing

Indian regulation includes requirements concerning manufacture, labelling, packing, government analysts/inspectors and related controls for Ayurvedic, Siddha and Unani drugs.

RAG use

Useful questions: What is a formulation? What information should be recorded for a medicinal plant? What is the difference between a traditional formulation and a proprietary product? What quality controls may apply?

Safety boundary

Do not use this knowledge base to generate personalized prescriptions, doses or treatment decisions. Such questions should be referred to a qualified practitioner and applicable official guidance.

Project note: This PDF is an original RAG-oriented summary created for the prototype. For legal, regulatory or medical decisions, use the current official source documents and qualified professionals.
