

07. Ayurveda Quality, Safety and Manufacturing Controls

IP-SAKTI Sahayak — RAG Knowledge Base

Purpose

Knowledge base for quality, safety and manufacturing-related questions.

Quality

Quality control can involve identity and quality of raw materials, manufacturing processes, testing, records, packaging and storage. Requirements depend on the applicable product and regulatory framework.

GMP

WHO and Indian regulatory materials discuss good manufacturing practices and quality systems for traditional medicines. GMP compliance is distinct from simply describing a product as traditional.

Testing

Government regulatory frameworks provide for government analysts, inspectors and testing-related controls for Ayurvedic, Siddha and Unani drugs.

Safety

Traditional use does not mean that every product is automatically safe for every person. The RAG assistant should avoid personalized safety claims and should distinguish general regulatory information from medical advice.

RAG use

Useful questions: What is GMP? Why is quality control important? What roles do inspectors and government analysts have? What should an AI answer include when asked whether an Ayurvedic product is safe?

Caution

For adverse reactions, interactions, pregnancy, children or serious symptoms, direct the user to a qualified healthcare professional.

Project note: This PDF is an original RAG-oriented summary created for the prototype. For legal, regulatory or medical decisions, use the current official source documents and qualified professionals.
